

Apache Web Server Installation & Maintenance

Troubleshooting

During the installation and configuration of the Apache web server, I faced repeated issues while trying to start the Apache service. Although the installation process completed successfully, every time I ran the command

```
sudo systemctl start apache2,
```

the service failed to start and displayed the message:

“Job for apache2.service failed because the control process exited with error code.”

I checked the logs using

```
sudo journalctl -xeu apache2.service
```

and also tested the configuration with

```
sudo apache2ctl configtest.
```

Despite multiple attempts to correct the issue by rechecking configuration files, firewall settings, and directory permissions, the problem persisted. It appeared to be a configuration or port conflict error that I could not resolve within the lab time.

As a result, the Apache service could not be started successfully on my system. However, the troubleshooting process helped me better understand how Apache manages its configuration files, services, and dependencies.

apache2 is already the newest version (2.4.58-1ubuntu8.8).  
The following package was automatically installed and is no longer required:  
  libllvm19  
Use 'sudo apt autoremove' to remove it.  
0 upgraded, 0 newly installed, 0 to remove and 0 not upgraded.  
tafriya-amin-habiba@tafriya-amin-habiba-VirtualBox:~$ sudo systemctl status apac
